Software revision

Software revision of all electronic devices.

If possible, only the devices to be checked should be powered, but the use of the main power supply system is allowed.

All potentially hazardous items (propellers, explosives, fuel, etc.) must be removed or secured.

This check is common for any platform, however, each customer should have its own checklist, as it is only an example provided by Embention as an aid.

"Hardware revision" checklist completed	
Verify that the firmware installed on all major systems is in the correct version	
Verify that the software installed on the ground equipment (or on-board equipment if applicable) is in the correct version	
Verify that the version of the configurations (PDIs) loaded in the main systems are correct (if applicable)	
In case of secondary systems (ESCs, ECUs) a revision will only be necessary in case the component has been recently modified or replaced
