5	Troubleshooting	19

INTRODUCTION

HIL Simulator is the Veronte application to perform HIL (Hardware In the Loop) simulations. This kind of simulation runs Veronte software with a real autopilot (**1x** or **4x**), taking simulator input as real sensor data. The whole flight is controlled by the real autopilot in a virtual environment, making it the perfect tool for vehicle development and training operators in the use of Veronte autopilot, prior to conducting real flight operations.

HIL simulator is designed for applications such as:

- Pilot training.
- Veronte configuration for unmanned platform control.
- PID setting.
- Mission configuration.
- Aircraft performance validation.

The operator can fly the system as a real flight, being compatible with main Veronte features: real-time mission edit, in-flight automatic to manual control, flight data recording. . . Sometimes, during an edition saving, the simulation fails because the simulation link suffers a little interruption (this fact does not exist in real flights).

Warning: When using HIL Simulator, real control actuators will move as a real flight. In order to avoid damage people or equipment, make sure that motors are disconnected and there is no shock risk due to actuators movement.

HIL Simulator is employed along with:

- **Veronte Link** to connect the autopilot with a computer. To read the user manual [click here](#).
- **Veronte Ops** to operate the autopilot during simulations. To read the user manual [click here](#).
- **Microsoft Flight Simulator** or **X Plane 11** to simulate flights.

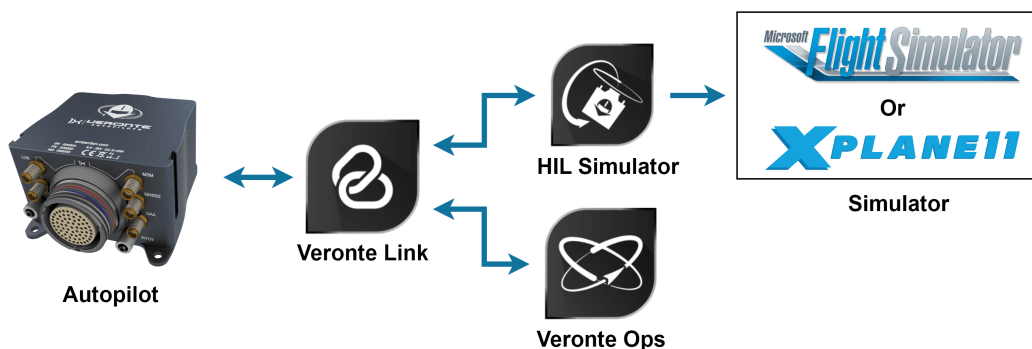

Fig. 1: Applications Diagram

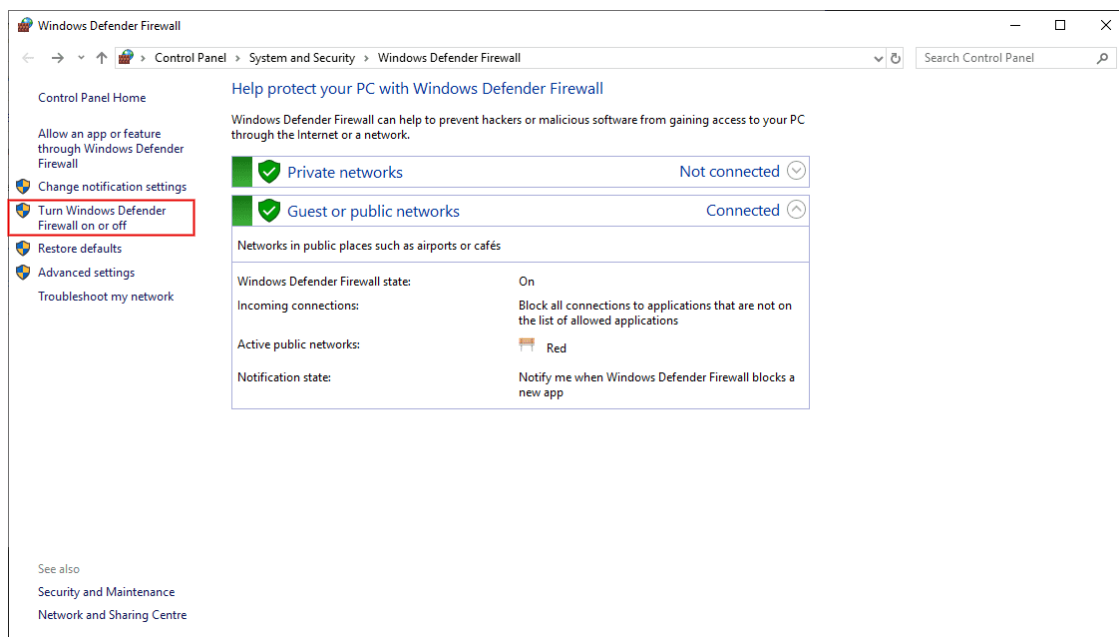

SOFTWARE INSTALLATION

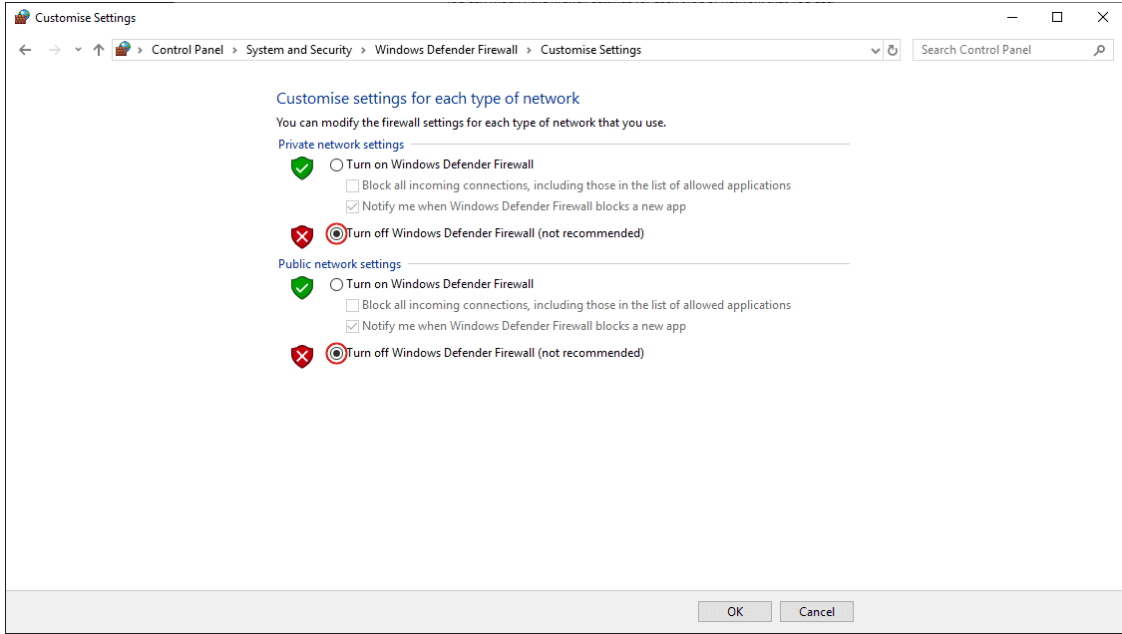

Once the **Veronte Autopilot 1x** has been purchased, a GitHub release should be created for the customer with the application.

To access to the release and download the software, read the [Releases section](#) of the **Joint Collaboration Framework** manual.

To install Hil Simulator on Windows, execute VeronteHil.exe and follow the Setup Wizard instructions.

In case of any issue during installation, please disable Windows Defender and Firewall. To disable Firewall, go to “Control Panel” and “Firewall of windows”, then click on **Turn off**.

OPERATION

To start using **HIL Simulator**, follow the next steps:

- **1. Connect the autopilot to a computer.**

Use **Veronte Link** to establish the connection, read the [user manual](#) for more information.

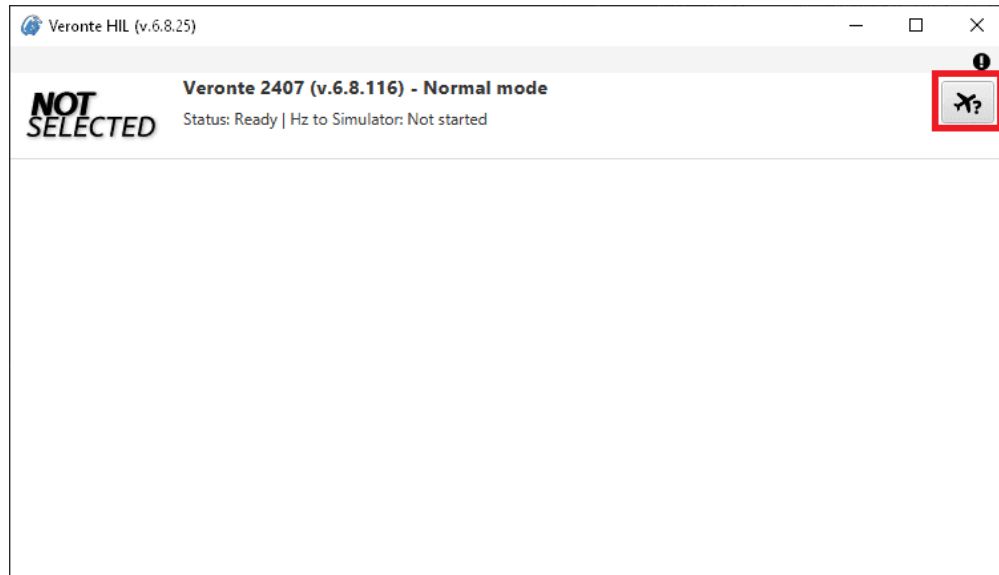

Fig. 1: **Open Veronte Link**

- **2. Open HIL Simulator.**

The following window will pop up for a second.

If the autopilot is properly connected, then the window will change as follows.

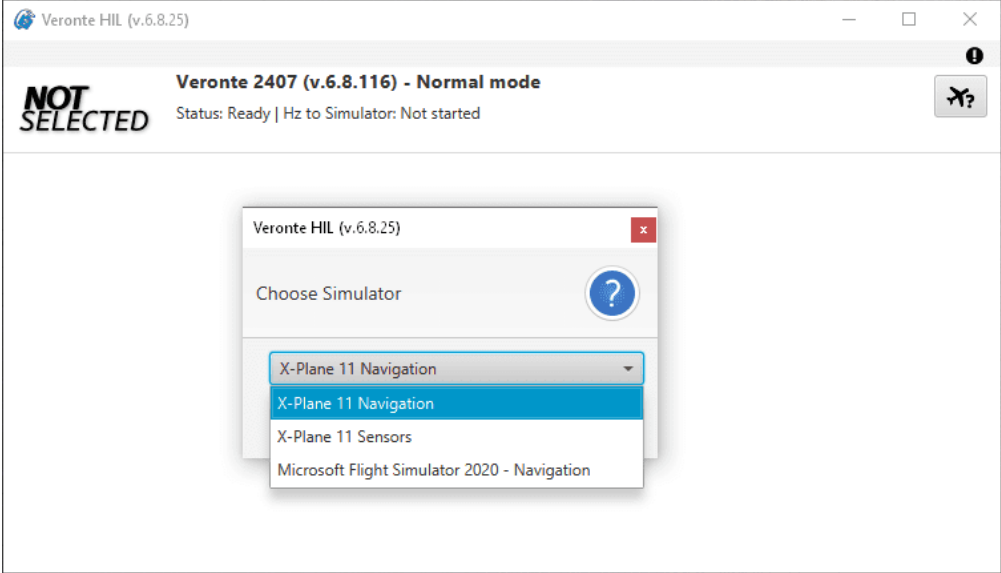

Note: HIL Simulator will run minimized in the Windows taskbar:

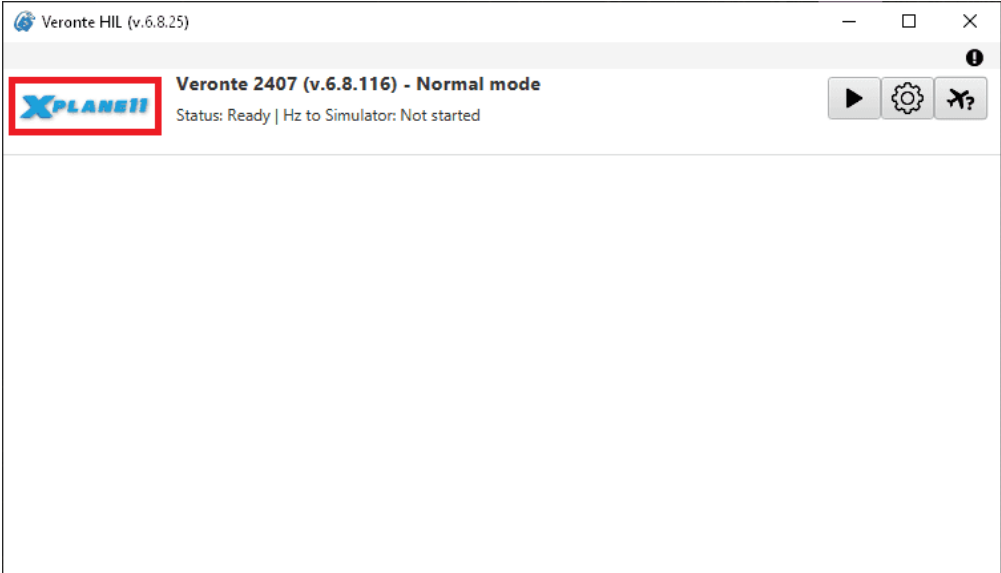

• **3. Choose a simulator.**

Click on  to choose one.

Then, **HIL Simulator** will be ready to start.

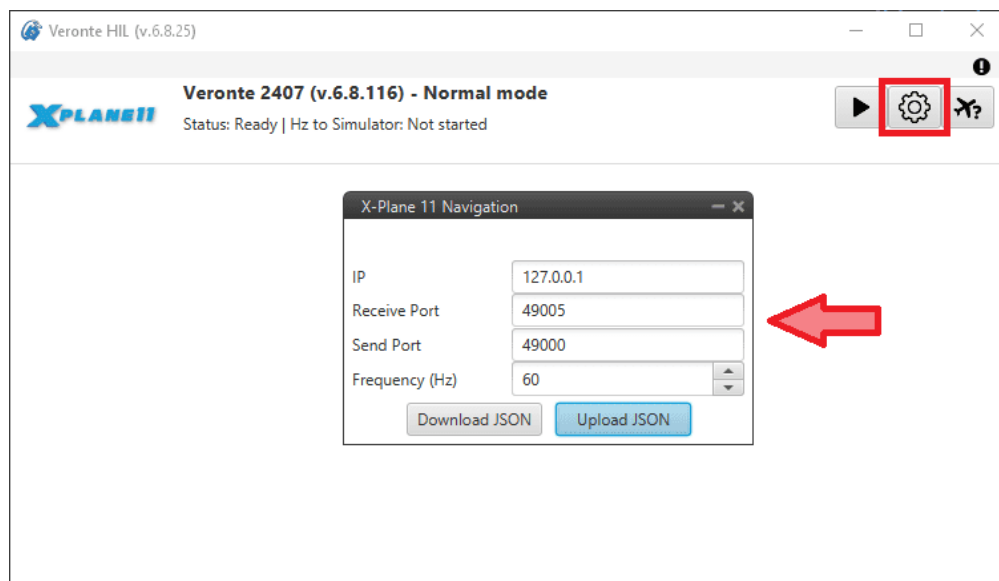

The following video summarizes steps 2 and 3:

Fig. 2: Open HIL simulator and choose simulator

- 4. Configure the simulator (optional).

Default configuration parameters are recommended. To change them, click on .

These four parameters must have the same value for the simulator. They are configured for **X-Plane 11** in *X-Plane Settings*. **Frequency (Hz)** of **Hil Simulator** corresponds to **UDP Rate** (packets per second) of X-Plane, since the autopilot sends and receives data at this frequency.

After following the previous steps, read *X-Plane 11* section to simulate the connected autopilot.

X-PLANE 11

Veronte systems are compatible with X-Plane 11 for HIL simulation. X-Plane 11 communications settings must be edited in order to have communication with Veronte systems. Follow the next steps in order to make a proper configuration.

Note: For low-performance computers, it may be needed to reduce the graphics quality on the simulator, as described below.

- **1. Aircraft Model Installation.**

X-Plane 11 simulator is compatible with a wide variety of platforms: airplane, helicopter, multicopter, surface vehicle... In order to create the platform model, Plane Maker tool provided by X-Plane 11 must be used. Once the aircraft model has been created, it can be integrated on the X-Plane 11 simulator by following the next sub steps:

- 1.1: Copy the model folder to the “Aircraft” folder within the X-Plane 11 installation directory.
- 1.2: Copy the content in the “Airfoils” folder, available in the aircraft model folder, to the “Airfoils” directory within the X-Plane 11 installation directory.

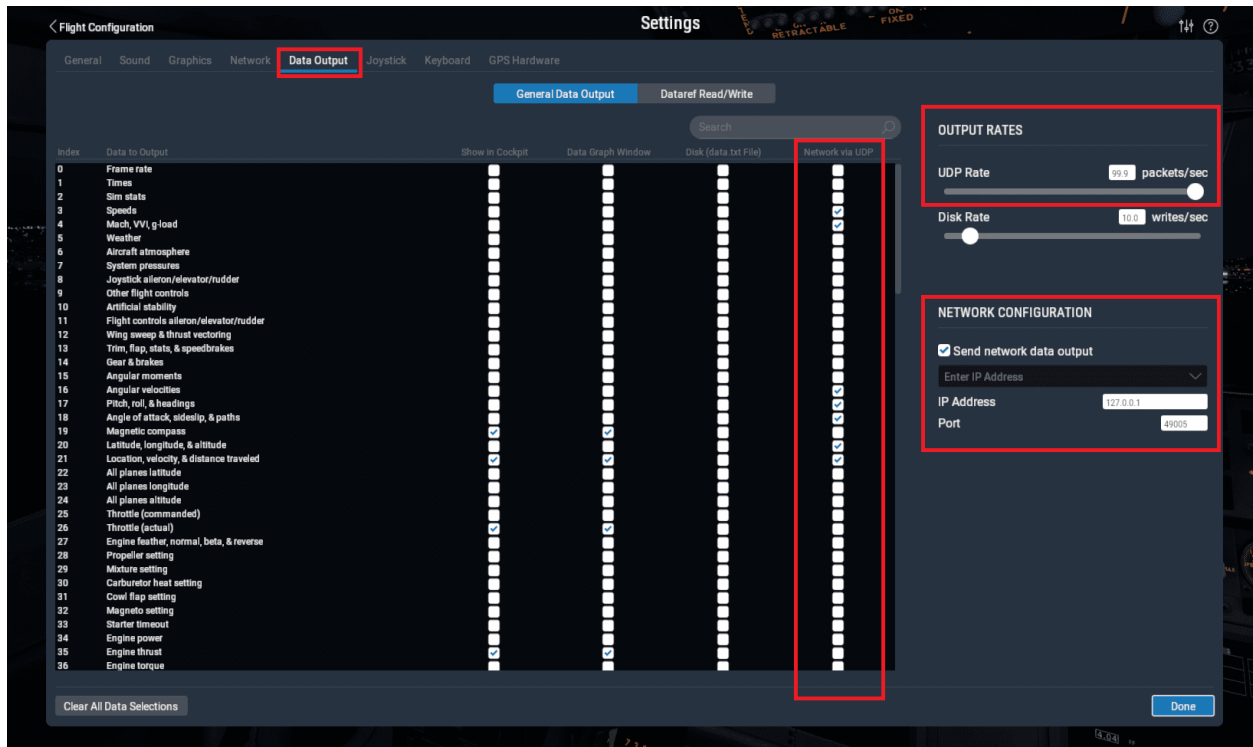

- **2. Custom airport.**

X-Plane flight starts from an airport; a custom airport must be defined for simulating in case of not having available airports. In addition, it is possible to create a new airport. In order to do that, the user should follow the X-Plane tutorial presented in the next [link](#). Once the airport has been created, copy the model folder to the X-Plane 11 installation directory.

- **3. X-Plane Settings.**

Data transmission settings of X-Plane must be edited on **Settings** ⇒ **Data Output**. This configuration must coincide with **Hil Simulator**. Select all the variables to sent through the UDP Network and set the UDP rate at maximum speed. The network configuration must be configured as shown in the following table and picture.

Parameter	Value
3 - Speeds	Mark <input checked="" type="checkbox"/> in the Network via UDP column
4 - Mach, VVI, g-load	
16 - Angular velocities	
17 - Pitch, roll & headings	
18 - Angle of attack, sideslip & paths	
20 - Latitude, longitude & altitude	
21 - Location, velocity & distance traveled	
IP	127.0.0.1
Receive port	49005
Send port	49000
UDP rate (packets / second)	Hil Simulator frequency, with 99 as maximum value

• **4. X-Plane 11 Setup.**

Open X-Plane 11 ⇒ **Main menu**. To start a simulation click on **New Flight**:

Then, the following window will be displayed. Select which **aircraft** to use, the starting **airport** and weather conditions to simulate. Finally, click on **Start Flight** to start the simulation:

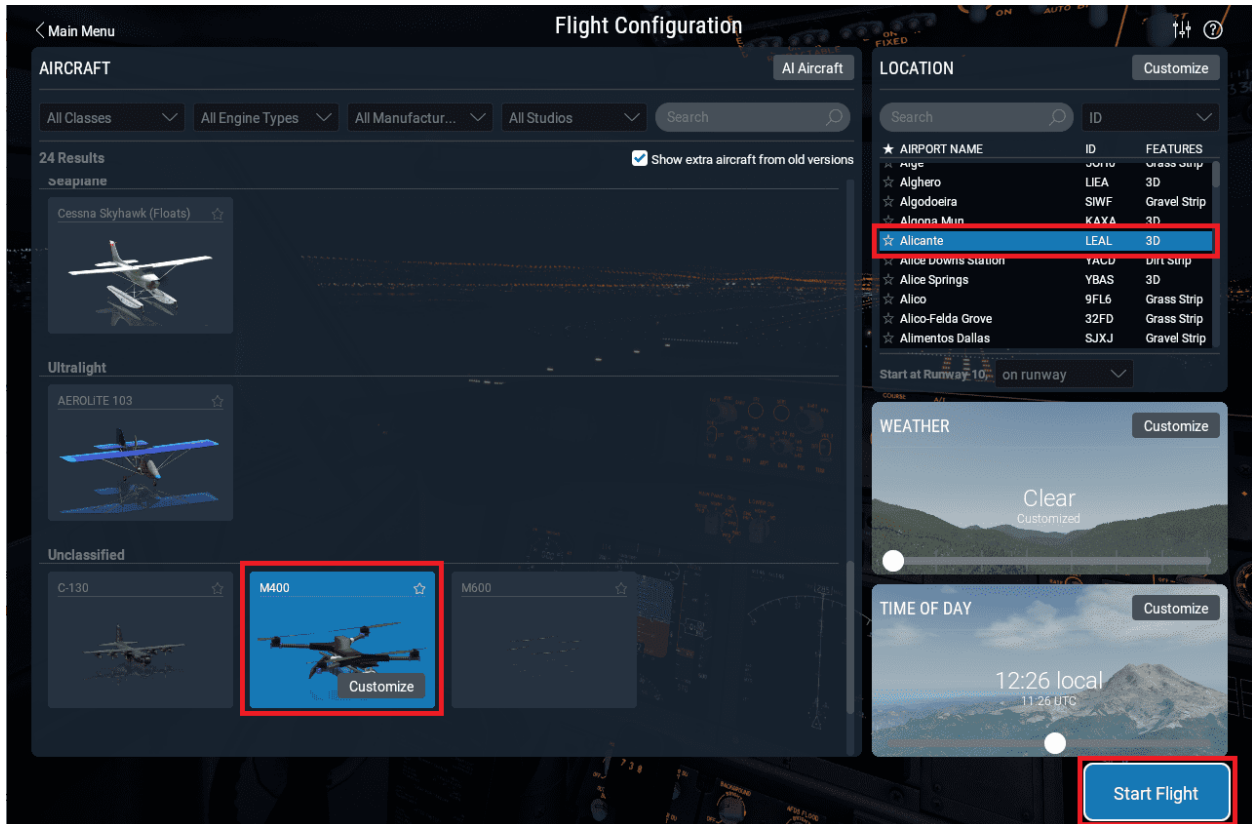

Fig. 1: X-Plane 11 Setup

- **5. Run simulation.**

Once X-Plane is configured, click on  of **HIL Simulator** to enable the sending of commands. The frequency to the simulator should then be set to, approximately, the previously configured frequency:

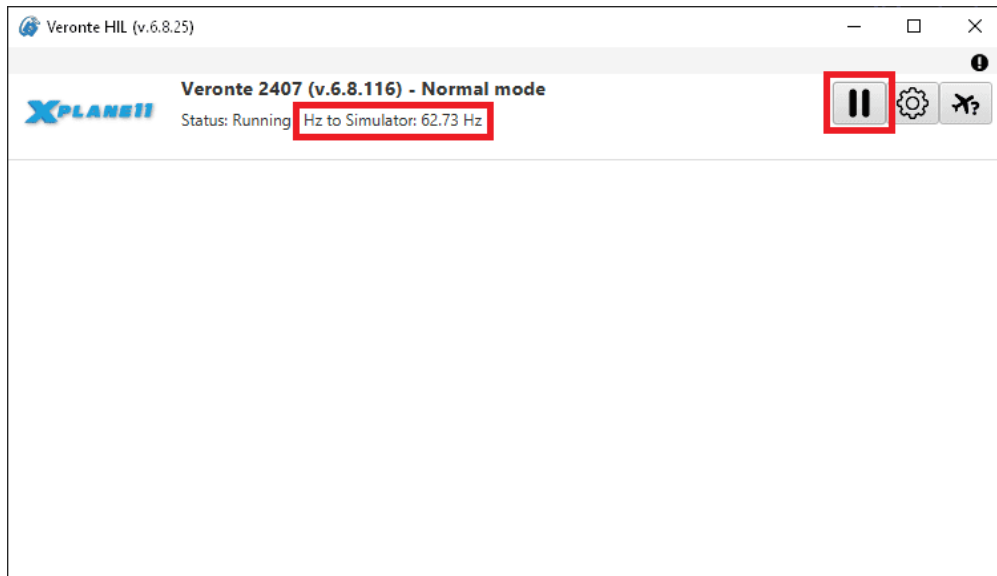

Fig. 2: HIL - Run simulation

- **6. Check sending/receiving data.**

Go to **Settings** ⇒ **Network tab**. Check that the *sending* and *receiving data to* is correct:

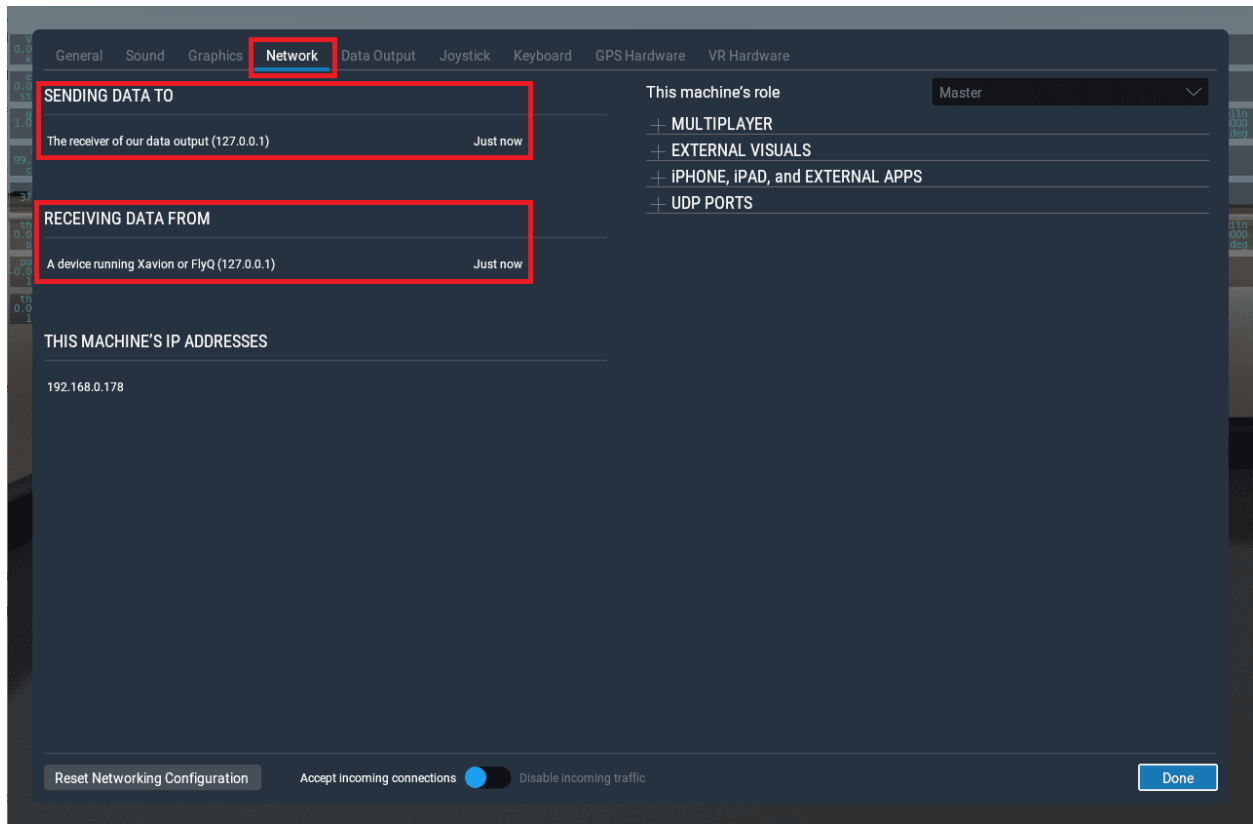

Fig. 3: Check sending/receiving data

Once the hardware has been connected and the software has been configured, operation can start and the system can be operated as a real flight.

GPS will be simulated and the UAV should be visible on **Veronte Ops** in the selected airport, with a colored icon as follows:

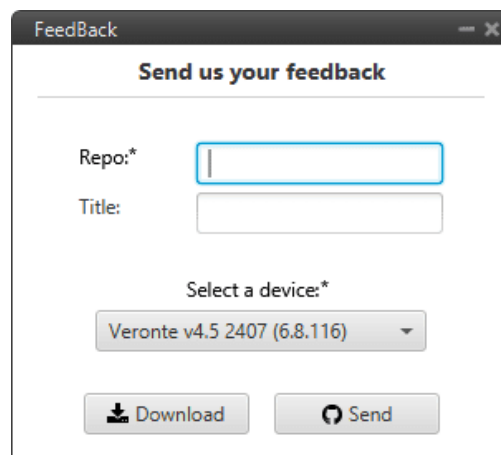

Fig. 4: Veronte Ops

Warning: The simulation starts when the aircraft is in the initial phase (when it is powered). In this phase, X-Plane will simulate the GPS signal to locate the autopilot.

With GPS signal it is possible to pass the system to Standby phase and to start flight. Once the aircraft has taken off from the airport on X-Plane, the automatic control will start and the aircraft will fly, according to the defined mission on **Veronte Ops**. For more information about **Veronte Ops**, read the [User Manual](#), remember to select the employed software version.

TROUBLESHOOTING

In case of any issue or suggestion, it is possible to send a report pressing .

The image shows a feedback dialog box titled "FeedBack" with a close button. The main heading is "Send us your feedback". It contains three input fields: "Repo:*" (with a blue border), "Title:" (with a grey border), and "Select a device:*" (a dropdown menu showing "Veronte v4.5 2407 (6.8.116)"). At the bottom, there are two buttons: "Download" with a download icon and "Send" with a circular arrow icon.
