ncois Bulder

MC01S PDI Builder is an application employed to configure the MC01S, the stepper variant of MC01.

CHAPTER

QUICK START

MC01S PDI Builder is the main tool for setting all configurable parameters of the MC01S.

Configuration for Veronte MC01S should be created according to the needs of the belonging system.

Once MC01S has been detected on Veronte Link, download and install MC01S PDI Builder.

1.1 System Requirements

Before executing this software, users should check the following sections with the minimum and recommended PC hardware requirements.

Minimum requirements

- CPU: Intel Core i5-8365UE
- RAM: 8 GB DDR4
- STO: 256 GB SSD

Recommended requirements

- CPU: 12th Gen Intel(R) Core(TM) i7-12700H 14 cores up to 4,70 GHz
- RAM: 32 GB
- STO: 1 TB SSD M.2 NVMe PCIe

1.2 Download

Once a MC01S device has been purchased, a GitHub release should be created for the customer with the application.

To access to the release and download the software, read the Releases section of the **Joint Collaboration Framework** manual.

1.3 Installation

To install MC01S PDI Builder on Windows, execute MC01SPDIBuilder.exe and follow the steps:

1. Click on Next:

Fig. 1: Windows Installation - Step 1

2. Read and accept the EULA (End-User License Agreement), then click on Next:

MC01SPDIBuilder-6.8.69 Setup —		\times
End-User License Agreement		
Please read the following license agreement carefully		S
END USER LICENSE AGREEMENT		^
(EULA)		
IMPORTANT: Please read the product terms and conditions t	hat

Fig. 2: Windows Installation - Step 2

3. Select the directory where where the software will be installed (with the **Change** button), then click on **Next**:

Fig. 3: Windows Installation - Step 3

4. Finally, click on **Install** (administrator rights are needed):

Fig. 4: Windows Installation - Step 4

5. After a few seconds, the following window will appear indicating the process was succesful. Click on Finish:

Fig. 5: Windows Installation - Step 5

Note: In case of any issue during installation, please disable Windows Defender and Firewall. To disable Firewall, go to "Control Panel" and "Firewall of windows", then click on **Turn off**.

CHAPTER

TWO

CONFIGURATION

This section explains each option and parameter available in MC01S PDI Builder.

Once the installation is finished, open MC01S PDI Builder and select the unit:

Fig. 1: MC01S ID

If it is correctly connected, it should appear in Normal mode, as shown in the following figure, or Maintenance mode:

Fig. 2: MC01S PDI Builder

MC01S unit can also appear as: Maintenance mode (loaded with errors) or Normal mode - Disconnected.

Note: Maintenance mode (loaded with errors) appears when something is wrong in the configuration.

The user can access now to 3 configuration options:

- **MC01S**: It allows the user to work with **offline** configurations. A previously exported MC01S PDI configuration can be opened and modified or it is also possible to build a new one from the default configuration.
- Upload PDI: A previously exported MC01S PDI configuration can be imported to the current MC01S flash memory.
- **Open MC01S**: By clicking on this option, **MC01S PDI Builder** configuration menu opens with the configuration (the PDI files) loaded in the MC01S. Then, the user can modify it online.

Note: PDI files are MC01S configuration files. These files allow for modular control with improved version management. These PDI files are split in 2 folders. Each folder holds several .xml files:

- vmc-stepper: Contains configuration for MC01S. All control system and parameters are stored here.
- **xsd**: This folder holds .xsd files. An XSD file is a definition file specifying the elements and attributes that can be part of an XML document. This ensures that data is properly interpreted, and errors are caught, resulting in appropriate XML validation. Users should never delete, replace or modify it.

Fig. 3: PDI files

Finally, click on '**Open MC01S**' to open the configuration and start editing online.

Note:	When MC01S PDI is open	n, the unit changes to Maintenance mode .	
-------	------------------------	--	--

The different 'buttons' that can be seen in the initial menu of the MC01S PDI Builder are explained below.

MC01SPDI Builder - MC01 30313 - CONNECTED	MC01S PDI Builder	×- • = • •
		1234 5
≅ <mark>-6</mark> @		

Fig. 5: Initial menu

1. Save PDI: After changes are done, press on the save button to apply the changes.

Note: This button will only appear if a MC01S is connected, i.e. when working offline this button will not be available.

2. **Export PDI**: After modifying a configuration, press the export button to store the configuration in the local storage.

Users can store this configuration in an empty folder or in the folder where the previously imported configuration is stored. With the latter option, the "original" configuration will be overwritten by the one with the new changes.

- 3. **Import PDI from repo**: The user can import a configuration file from the repo and modify it. After that, if the save button is pressed, this configuration will be uploaded to the connected MC01S.
- 4. **Import PDI from local storage**: The user can import a configuration file from the local storage and modify it. After that, if the save button is pressed, this configuration will be loaded into the connected MC01S.
- 5. Feedback: Users can report a problem they have encountered by creating an issue in their own 'Joint Collaboration Framework'. The 'Download' button downloads a zipped folder with the current MC01S configuration and more information needed for Embention to resolve the issue. It is advisable to attach this folder when creating the issue.

Note: The user's 'Joint Collaboration Framework' is simply a own Github repository for each customer.

If the user has any questions about this Joint Collaboration Framework, please see Joint Collaboration Framework user manual.

Fig. 6: Feedback window

6. These are the different functions of MC01S. They are explained in the following sections:

- Enable VCP Status Message enables the periodic sending of the status message that Veronte Link uses to recognise the Veronte MC01S.
- Period: Enter a desired period to send repeatedly the status message.

MC01SPDI Builder - MC01 30313 - CONNECTED			- ×
	O VMC Stepper	8 1 8	0
Image: Constraint of the second of the se			

Fig. 7: VMC Stepper menu

Note: VCP is the Veronte Communication Protocol. To know more, read the VCP user manual.

2.2 Contemport

MC01S can send and receive messages through a CAN bus with Serial protocol, this communication system is named as Serial-Over-CAN. This is necessary to establish the communication with a Veronte Autopilot 1x.

Note: TX corresponds to transmitted messages and RX to received messages.

First of all, it is necessary to set the appropriate **Baudrate** (i.e. the communication speed, expressed in bits per second) of the CAN bus.

2.2.1 SCIA Serial CAN

Serial messages received/sent through the SCIA (RS-232) port can be sent via CAN.

This menu internally configures the following connection:

Fig. 8: Input/Output menu - SCIA Serial CAN schema

MC01SP	PDI Builder - MC01 30313 - CONNECTED						- x
		• 🛟 Input / Output			8	0 5	0
Ö	Baudrate 1000	000.0 Bd					
* #	SCIA Serial CAN						
8	тх	RX					
	Extended	Extended

	Timeout 6.7E-4 s	Number of mailboxes used for rx	12				
	Commgr Serial CAN			•			
	ТХ	RX					
	Extended	Extended					
	CAN 1301	CAN	1302				
	Timeout 6.7E-4 s	Number of mailboxes used for rx	12				
	CAN id used for CAN motor comm	ands					
	Extended						
	CAN 1						
	Number of mailboxes used for rx						

Fig. 9: Input/Output menu - SCIA Serial CAN section

• TX:

- **Extended**: If enabled, the frame format will be this, 'Extended', i.e. with a 29-bit identifier. Otherwise, the frame format 'Standard' (11-bit identifier) is set by default.
- CAN: CAN Id of the message to be sent must be set. The value set has to be decimal format.
- Timeout: This is the threshold time between receptions to consider that it is not being received correctly.
- RX: Configuration for receiving messages (as Mailboxes in the Veronte Autopilot 1x configuration)
 - Extended: Select this option for 29-bit IDs.
 - CAN: 11-bits (Standard) or 29-bits (Extended) ID used to identify the CAN message to be received. The value set has to be decimal format.
 - Number of mailboxes used for rx.

2.2.2 Commgr Serial CAN

Serial messages received/sent through the Commgr port can be sent via CAN.

Warning: This configuration is already done by default in order to allow communication via CAN between 1x Autopilot and MC01S. **It must not be modified**.

This menu internally configures the following connection:

Fig. 10: Input/Output menu - Commgr Serial CAN schema

MC01SF	PDI Builder - MC01 30313 - CONNECTED		- x						
	• 🔂 Input / Output								
0	Baudrate 1000	000.0 Bd							
+ H E	SCIA Serial CAN TX Extended CAN 1303 Timeout 6.7E-4 s	RX Extended CAN Number of mailboxes used for rx 12							
Commgr Serial CAN TX Extended CAN 1301 Timeout 6.7E-4 s		RX Extended CAN 1302 Number of mailboxes used for rx 12							
	CAN id used for CAN motor comm Extended CAN I Number of mailboxes used for rx I	ands							

Fig. 11: Input/Output menu - Commgr Serial CAN section

• TX:

- **Extended**: If enabled, the frame format will be this, 'Extended', i.e. with a 29-bit identifier. Otherwise, the frame format 'Standard' (11-bit identifier) is set by default.
- CAN: CAN Id of the message to be sent must be set. The value set has to be decimal format.
- Timeout: This is the threshold time between receptions to consider that it is not being received correctly.
- RX: Configuration for receiving messages (as Mailboxes in the Veronte Autopilot 1x configuration)
 - Extended: Select this option for 29-bit IDs.
 - CAN: 11-bits (Standard) or 29-bits (Extended) ID used to identify the CAN message to be received. The value set has to be decimal format.
 - Number of mailboxes used for rx.

2.2.3 CAN id used for CAN motor commands

MC01S requires a CAN id to send the desired position to the motor.

MC01SP	DI Builder - MC01 30313 - CONNECTED	•🕁 Input / Output		- × • ± č t
() ~~	Baudrate 1000 SCIA Serial CAN	000.0 Bd		
	TX Extended CAN 1303 Timeout 6.7E-4 s	RX Extended CAN Number of mailboxes used for rx	1304	
	Commgr Serial CAN TX Extended CAN 1301	RX Extended CAN	1302	
	Timeout 6.7E-4 s CAN id used for CAN motor comm Extended CAN 1 Number of mailboxes used for rx 1	Number of mailboxes used for rx	12	

Fig. 12: Input/Output menu - CAN id used for CAN motor commands section

- **Extended**: If enabled, the frame format will be this, 'Extended', i.e. with a 29-bit identifier. Otherwise, the frame format 'Standard' (11-bit identifier) is set by default.
- CAN: CAN Id through which the MC01S will send the position of the motor.
- Number of mailboxes for rx.

2.3 \Xi Control

2.3.1 Control Stepper

First, the PI (Proportional and Integral) controller is presented.

The form of the PI is the classical parallel form (expressed with Laplace notation):

$$u = K_p \cdot \left(1 + \frac{1}{T_i} \cdot s\right)$$

Where:

- K_p is the **Proportional loop gain**.
- Integral gain refers to the quotient $\frac{1}{T_i}$.
- Lower and Upper saturation gain are the limits to which the PI limit its output.

Control Stepper is the main control menu, where users must enter the control parameters according to their motor.

The basic block that define the control is PI control loop that should be tuned with the motor characterization.

MC01SPDI Builder - MC	01 30313 - CONNECTED		- ×
	-	E Control	8 2 5 0
Control Ste Limits Encoder	pper Position controller Proportional loop ga Integral gain Lower saturation gai Upper saturation gai Max falling rate	in 0.6 0.0 -0.34 0.34 -5.0 5.0 5.0 0utput frequency 0.034	

Fig. 13: Control Stepper section

• Position controller: It is controlled by a *PI control*.

Maximum desired motor acceleration:

- Max falling rate: Deceleration rate. Expressed in rad/s^2 .
- Max rising rate: Acceleration rate. Expressed in rad/s^2 .

• Dead band for pulse output frequency: This is a calibration value.

• Speed filter time constant: This is the time constant of the first order filter of the speed calculation. The lower value, the lower filtering.

The time constant is approximately defined as:

$$\tau = \frac{1}{2 \pi f_c}$$

Where:

- τ : time constant
- f_c : cutoff frequency

2.3.2 Limits

This section allows the user to limit the motor movement by software:

MC01SPDI Builder - MC01 30313 - CONNECTED - X						
		靠 Control	8	0		
\bigcirc	Control Stepper	Angle rate				
	Limits Encoder	Center range	0.0			
•		Center position bound

		view Mechanical Linits				
@ _11						

Fig. 14: Limits section

• Angle rate

- Center range: Encoder position at the center of the motor range
- Center position bound: Encoder position center of motor's mechanical limits.
- View Mechanical Limits: This panel uses mechanical calibration settings to transform between encoder and mechanical angles.

So, please, edit only if mechanical angle calibration settings are correct.

2.3.3 Encoder

In this section, the user must define the number of bits employed by the encoder to communicate the position of the motor.

MC01SPDI Builder - MC01 30313 - CONNEC	TED 🔁 Control	×- 0 4 6 4
Control Stepper Limits Encoder Image: Control Stepper I	Number of bits: 10	

Fig. 15: Encoder section

2.4 Communications

MC01S can only use one serial peripheral, SCIA port, the serial parameters that fit the serial protocol requirements can be edited in this menu:

MC01SPDI Builder - MC01 30313 - CONNECTED - X					
			Communications		
	Functionality				
•	Baudrate	57600 -			
	Length	8 👻			
	Stop	1 -			
4	Parity	Disabled 👻			
.	Use address	mode			

Fig. 16: Communications menu

- Baudrate: This field specifies how fast data is sent over a serial line.
- Length: Defines the number of data bits for each character: 4 to 8 bits.
- Stop: Number of stop bits sent at the end of each character: 1, 1.5 or 2.
- **Parity**: Method to detect errors during transmission. When parity is used with a serial port, an extra data bit will be sent with each data character.

The bits of each character (including parity bit) will be even or odd according to **parity** mode (**odd**, **even** or **disabled**).

• Use address mode: 9-bit data framing uses the bit typically associated with parity error detection to identify address messages. Sent serial data that does not have the address bit set will be ignored (unless the device had previously identified an address message associated with it).

This option can be disabled or enabled.

2.5 🛄 Telemetry

In the Telemetry menu, the user chooses the variable or group of variables to be sent via the CAN bus. The following items can be configured:

MC01SPD	I Builder - MC01 30313 - CONNECTED	- ×
	<u>III</u> Telemetry	
	01 💽	
	Memory usage: 0 / 512000 bytes	

Fig. 17: Telemetry menu

By clicking on the + icon more messages can be added and by clicking on the icon, messages can be deleted. Messages are configured clicking on the icon.

Since this section works in a similar way to the CAN Custom Message configuration in the **1x PDI Builder software**, the explanation to configure the telemetry messages via CAN can be found in the CAN Setup -> Input/Output section of the **1x PDI Builder user manual**.
